SKIMMI AI

System architecture — overview

A web study assistant that answers questions from a student's own documents: the browser app, the backend, and the services it relies on.

COLOUR KEY

- runs in the student's browser
- backend code (Python)
- Supabase cloud services
- on the backend server's disk / memory
- Google Gemini (external AI)

Numbered arrows: **1** sign-in · **2** API calls · **3** database and files · **4** search index · **5** AI answers. Every arrow carries only the signed-in user's data.

HOW IT WORKS

- **A** **Upload:** the file is stored, split into chunks, embedded and indexed.
- **B** **Ask:** the most relevant chunks of the student's own documents go to Gemini with the question.
- **C** **Answer:** shown with its sources (file + page) and saved to the chat.

Simplified view. See Skimmi-System-Architecture.pdf for the detailed version.
